- VSCode Version: Version 1.8.0-insider
- OS Version: 10.12.1

There used to be a way to access the web inspector to inspect VSCode itself. It seems to be gone now.

As a theme author, how do I inspect the scope of items on the screen in order for me to color the scopes in my tmTheme file? Is there a new method?

You still should be able to go to the Help -> Toggle Developer Tools menu item to inspect the vscode dom. Is that menu item missing for you?
