toggle show/hide activity bar

I often hide activity bar to widen the editor space but also often show it to see the folder structure/open a file. I know there is no default shortcut to toggle this function, but making customized keybinding seems to complicate/interface some functionalities. What is the good keybinding you can think of for this?

it can be done through

views > appearance > Hide / show activitybar.

or

most awesome add a custom keyboard shortcut

```
10 // for vscode, use vscode-theme-color-theme.json
11 var parseXML = function( data ) {
12   var xml, tmp;
13   if ( !data || typeof data !== "string" ) {
14     return null;
15   }
16   try {
17     if ( window.DOMParser ) { // Standard
18       tmp = new DOMParser();
19       xml = tmp.parseFromString( data , "text/xml" );
20     } else { // IE
21       xml = new ActiveXObject( "Microsoft.XMLDOM" );
22       xml.async = false;
23       xml.loadXML( data );
24     }
25   } catch( e ) {
26     xml = undefined;
27   }
28   if ( !xml || !xml.documentElement || xml.getElementsByTagName( "parsererror" ).length ) {
29     jQuery.error( "Invalid XML: " + data );
30   }
31   return xml;
32 }
33
34 // Bind a function to a context, optionally partially applying any arguments.
35 var proxy = function( fn, context ) {
36   var tmp, args, proxy;
37
38   if ( typeof context === "string" ) {
39     tmp = fn[ context ];
40     context = fn;
```

The screenshot shows the VS Code editor interface. The main editor window displays a JavaScript file named 'sample.js' containing a function 'parseXML' and a 'proxy' function. The 'parseXML' function is designed to parse XML strings, handling both standard DOMParser and older Internet Explorer's ActiveXObject. It returns the parsed XML document or throws an error if the XML is invalid. The 'proxy' function is a utility for binding a function to a specific context. The right sidebar shows the 'OUTLINE' view, which lists the symbols in the current file, including variables like 'tmp', 'args', 'proxy', and 'xml', as well as function calls like 'jQuery.error'.

Tell me everything you wish you knew before you started with VS Code!

Especially when it comes to setting up VS Code for long-term use; I'm talking multiple projects in different languages (C, C++, Python), compiler/debugger/intellisense per language, what extensions are absolutely a must-have... Anything you learned that you would like to share!

How to do multiple projects in vscode?

Hey guys, I'm just switching from vscode after a year of vim+tmux and doom-emacs. I'm still new so sometimes i have to copy code I've already done in previous projects. In vim+tmux it's a simple matter of opening a new instance in tmux and open the other project in that instance and go around using ctrl+b next and in doom-emacs there's the projectile extension with spc+p+p which lists all your projects and you can easily swap around them. Is there any way to do something similar in vscode? I'm currently thinking of opening two instances of vscode (i think the nearock extension gives you different
